

TheraPet™ Overview

Infrared therapy is not new to the veterinarian field. In fact, it has been used in the equine market for more than 20 years. In the early stages of light emitting diode (LED) technology, infrared light was often used to treat performance racehorses for a variety of injuries ranging from abrasions to strained muscles and tendons. Light therapy, or phototherapy, as it is sometimes called, has been researched for over 40 years and studies show it has very powerful therapeutic effects, with multiple positive changes at the cellular level. The use of infrared treatment has saved a number of animals from being put down due to injury and non-healing wounds.

Some of the proven effects and benefits of using TheraPet™ for your pet include:

- Relieves chronic pain
- Increases blood flow
- Decreases joint stiffness
- Relieves muscle spasms and cramps
- Accelerate wound recovery
- Ease arthritic pains
- Reduce the risk of infection
- Bring your animal to peak performance
- Reduce the pain of arthritis
- Ease pain from muscle or tendon injuries
- Heal skin wounds
- Reduce joint and back pain
- Ease muscular skeletal illness
- Reduce inflammation
- Increase the speed and quality of tissue repair
- Boost immune system
- Improve the function of damaged nerve tissue by reducing the scar tissue surrounding it

Over the years the application of infrared therapy has not drifted far. The applications and known benefits have simply increased, as well as the technology has vastly improved. TheraPet™ utilizes highly rated IR LEDs and an advanced patented configuration to bring you the most effective non-invasive treatment available for your animal.

Glendale News Veterinary Article, 2008: Low-Level Laser Therapy Now a Common Procedure

“The introduction of our Low Level Laser in 2006 has been met with tremendous success in our practice! It has now become a routine and integral part of our patients’ treatment and management protocols. It works by stimulating the body’s natural healing mechanisms at the cellular level. Low-intensity laser therapy can be used to treat arthritis, muscle or tendon injuries, skin wounds, back pain, joint pain and other musculoskeletal illnesses. Laser therapy may also provide pain relief, resolve inflammation, increase the speed and quality of tissue repair, boost the immune system, help resolve infection, and improve the function of damaged nerve tissue by reducing the scar tissue surrounding it. The hospital’s laser is hand-held, and delivers laser light through the skin surface. It is painless and pets appear oblivious to the treatment as it is being delivered. Check out all our services including laser therapy here.”

TheraPet™ package includes:

- 1 TheraPet™ LED device
- 1 AC/DC battery charger
- 2 straps
- 1 long life lithium battery
- Patented LED light array
- 1 manual
- 1 warranty / registration www.therapet.ca

TheraPet™ brings light emitting diode (LED) light therapy to your pet for a proven, safe, natural treatment at an affordable cost.
